Compassionate Handling Series

Horses, Donkeys & Mules

BROOKE
ACTION FOR WORKING Horses AND DONKEYS
Handling describes how humans work with, respond to, and interact with animals within their surroundings. It is unavoidable when living and working with animals and can have profound and lasting effects on both animals and humans.

**Horses, Donkeys & Mules**

- **Being an equine vet is the most dangerous profession in the UK. Equine vets sustain more injuries than people working in the construction industry, prison service, and the fire brigade.**

- **Fearful horses perform worse on tasks when there are stressors such as tapping with a stick, isolation, or sudden stimuli in their environment (e.g. noise or light).**

- **Horses experienced higher stress levels when being stroked by someone who felt negatively about them, than by someone who liked horses.**

- **Horses remembered how an individual human behaved towards them based on just one interaction, even as long as eight months later, and behaved better with handlers who used positive handling techniques, such as stroking or speaking in a soft voice.**

- **Mules outperformed horses, donkeys and dogs in a problem-solving task, making them flexible learners, rather than stubborn, as they are often called.**

- **Mules show more aggressive and avoidance behaviours to unfamiliar handlers, than those they knew.**

- **Wild donkeys are territorial with respect to resources like water or food, more than horses.**

- **Donkeys are less likely to flee a threatening situation than horses are – this may present as aggressive behaviour or the donkeys may appear 'shut down'. Just because a donkey is tolerating something, doesn't mean they are enjoying it!**

- **Consistent use of positive handling techniques will minimise the risk of a negative reaction from an animal.**

- **Handlers should be aware of their own attitudes and feelings to minimise stress in animals and the risk of injury to themselves.**

- **Allow handlers and animals time to establish relationships when working together, and try and keep partnerships consistent where possible.**

- **Compassionate handling is essential to ensure horses can learn and perform tasks well.**

- **Compassionate handling should be included in veterinary professional training, to ensure this is a key component in procedures.**

- **Equids are quick to learn and handlers should plan training of animals carefully and use positive handling techniques to prevent the animals from learning undesirable behaviour.**

- **Compassionate handling leads to better outcomes for equines, a safer work environment for vets and faster results for equine trainers. We commit to handling animals with compassion – wherever, whenever and with whomever it takes place – so that all animals experience a positive human-animal relationship throughout their lifetime.**
